107104 Randomized Small Fixation Disparity Polarized Target

- The Randomized Small Fixation Disparity Polarized Target is an assessment tool for measuring binocular/accommodative function during a saccadic eye movement task using a sequence of saccadic identification targets. This vectographic silver card features five rows of saccadic Fixation Disparity Cross stimuli presented with a 20/63 target size to monitor visual, binocular & accommodative functions more reflective of reading demands at higher grade levels (smaller print books). The two-dimensional Fixation Disparity Cross stimuli with a Number Central Fusion Lock helps relate the binocular alignment to accommodation (clarity of the target).
- The Randomized Small Fixation Disparity Polarized Target has an answer key imprinted on the back of the card for checking number accuracy and includes a manual and a standard polarized viewer.
